## Memorial Hospitals Group Introduction

**A World Brand carrying  
the Future to Present !**

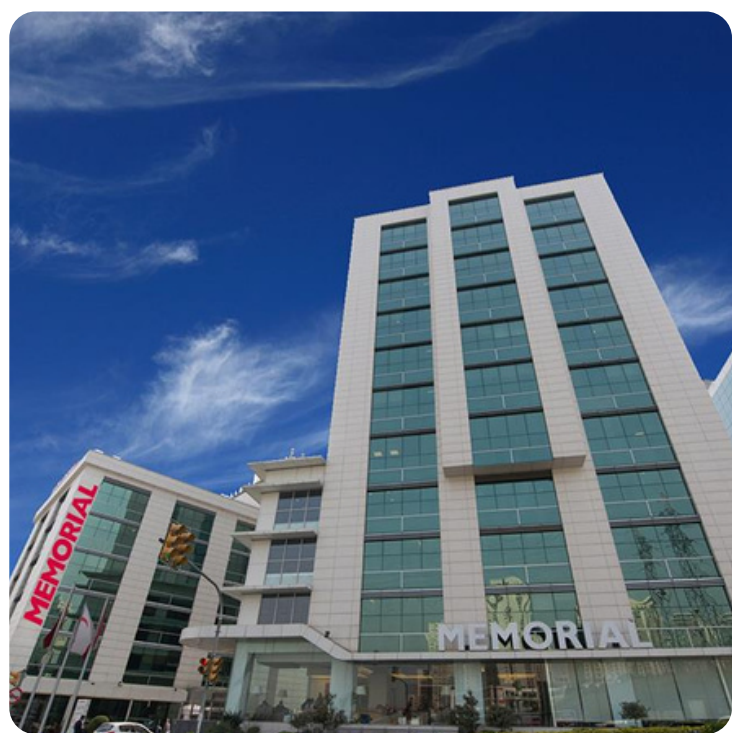

## Who we are?

With **12 hospitals** and **2 medical centers** and **1 wellness center** in 5 Turkish cities, we serve **+75 K international patients** from **+167 countries** annually.

Memorial **Bahçelievler**

Memorial **Ataşehir**

Memorial **Şişli**

Memorial **Antalya**

## Why Memorial?

Memorial Hospitals focus on **patient satisfaction** in order to provide high quality service by using international measurement methods and improvement mechanisms to ensure the **World Class** health services are provided to it's patients.

Turkey's first JCI  
Accreditation  
Certificate

ISO Accreditation  
Certificate in Genetics  
and IVF Laboratory

First Leed Platinum  
Certificate in Healthcare  
Industry in the World

EFI Immunology  
Laboratory  
Accreditation

## Our Advantages

More than **24 years**  
of **experience**

Highly qualified **medical**  
& **support staff**

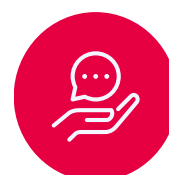

International  
**Patient Center**

**5 Stars Hotel**

**VIP Transfers**

**Free Consultation**

## What is Hair Transplantation ?

The question is frequently asked by users. Hair Transplantation is the process of transplanting healthy hair follicles using microsurgical methods to areas where hair follicles are no longer active and balding occurs. In hair transplantation, the patient's own healthy hair is added to the lost area. Hair transplantation is planned and implemented completely individually.

During the hair transplantation operation, hair follicles that are resistant to loss, usually in the nape of the patient's neck, are collected and transplanted into the channels opened in the areas where there is thinning or complete hair loss.

## Sapphire FUE Transplant

**Highest number of grafts**  
with most efficient equipment & technique.

**Sapphire Blades**  
The cuts made with a sapphire blade, and there is less tissue damage

**Medical Tests**  
Blood Test & Check Up

**Pain Free**  
Operation with Sedation

**Fastest Healing**  
You can turn back to your social life earlier.

**Laser Hair Regrowth**  
Treatment as part of the surgery

## How is Hair Transplanted?

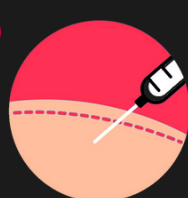

1

Designing

In practice, **hair follicles are generally taken** from the nape of the neck and transplanted to the **targeted bald area**. These taken hair follicles are called **grafts**.

2

Local  
Anesthesia

The application takes a **few hours depending on the amount of hair loss**. If the balding area is very large, several sessions may be required to complete the treatment.

3

Harvest  
from Donor  
Area

Generally, the intervention is performed under **Local Anesthesia**. Rarely, hair transplantation can be performed by putting patients to sleep under a procedure we call **sedation**.

4

Hair  
Transplant

**After hair transplantation**, a special bandage is applied to the harvested part. In the first days after hair transplantation, **the medications to be used and the necessary information** are given and the patients are discharged immediately after the procedure.

5

Final  
Result

The bandage is removed on the **1st or 2nd day after hair transplantation** and patients can then return to their daily lives. Patients get rid of the crusts within **7-10 days after the hair transplantation procedure and completely return to their pre-transplantation state**.

## Frequently Asked Questions

### What happens after the surgery?

It is important to follow the post-operative instructions provided by your surgeon to ensure optimal healing and hair growth. This may include avoiding certain activities or products, taking prescribed medications, and attending follow-up appointments. Patients may experience some temporary side effects such as swelling, scabbing, itching, and numbness, which typically resolve within a few weeks to a few months. Follow-up visits are important for monitoring progress and assessing the results of the procedure.

### Are there any complications from surgery?

Some potential complications of hair transplant surgery may include bleeding, infection, scarring, poor hair growth or unnatural-looking results, swelling, itching, numbness, and shock loss.

### Does the procedure hurt?

To clarify further, local anesthesia is used to numb the area where hair follicles are extracted and transplanted, so you won't feel any pain during the surgery. Intravenous sedation may also be used to help you relax and feel more comfortable during the procedure.

### Will my transplanted hair eventually fall out?

Yes, the transplanted hair is generally permanent and is not expected to fall out. The transplanted hair follicles are taken from areas of the scalp that are genetically resistant to balding and are therefore unlikely to fall out in the future.

### Will I be able to swim and enjoy other physical activities with my new hair?

Yes, you should be able to swim and participate in physical activities with your new hair after a short recovery period like 1 month. The transplanted hair is permanent and can be washed, cut, and dyed like your natural hair.
